Task 3.1:

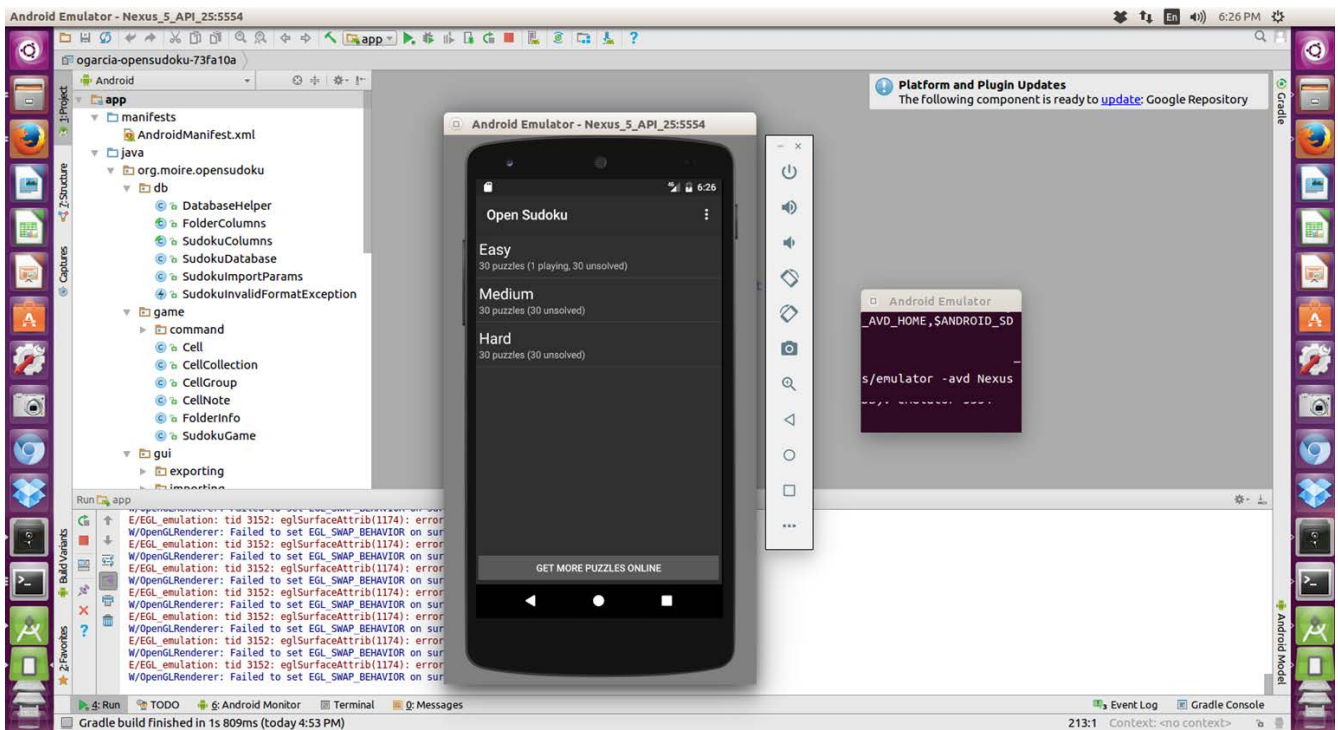

In order to compile the opensudoku source code as-is, I just went to their website and downloaded the file as .zip. I then extracted the zip file to my download folder. Afterwards, I opened Android Studio and chose "Open an existing project", choosing the destination of the unzipped folder. Surprisingly, the project compiled with no issues, so I was able to run the application successfully on both my virtual device and my actual device.

Task 3.2:

Task 3.3:

I had a bit of trouble logging into Firebase Storage because I didn't know that Anonymous Login has to be enabled through the Firebase console. I wasn't able to use the emulator to log in because the Google Play version isn't up to date, and it can't be updated on an emulated device.

Task 3.4:
